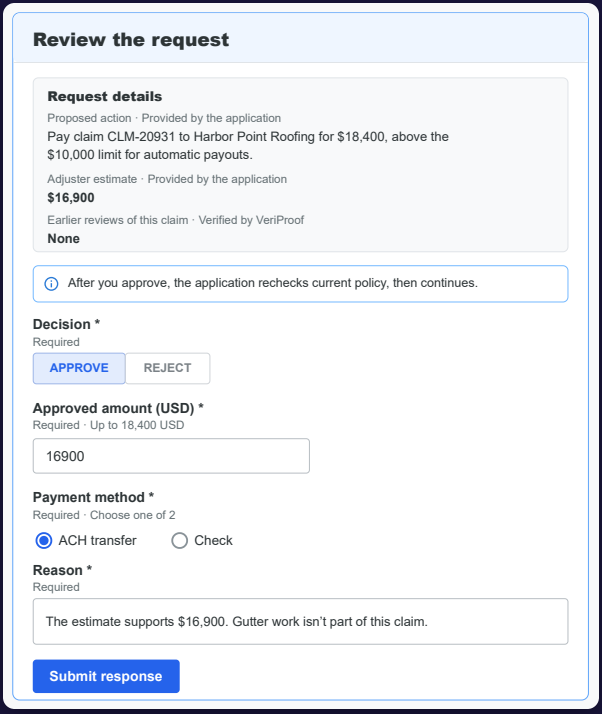
VeriProof

For leaders who answer for what their agents do

HUMAN-IN-THE-LOOP REVIEW

The right person decides before your agents act.

Agent frameworks can pause for an approval. VeriProof turns that pause into a review your business can run on, so agents can take on payouts and refunds while the person who answers for each one makes the call from Teams, Slack, ServiceNow or the VeriProof portal.



Microsoft Teams

A personal card for each reviewer, or a channel post for a group. Answers are tied to the reviewer's Microsoft work account.

Slack

A direct message, or a post in a private channel for a group. Each Slack account is linked to its VeriProof reviewer, and guests can't decide.

ServiceNow

The review opens on the reviewer's own ticket, in an app you install privately. Closing the ticket never approves anything.

VeriProof portal

Any review can be decided here, with the full request and the source of each detail beside it. Email notices link straight to it.

Sent to the people who own it

Send a review to one person or a whole group, and the first available reviewer takes it. If it runs late, the application's owners are notified, and it can move to a backup reviewer you named.

Decided by someone with authority

VeriProof confirms who is answering in each channel and checks they're allowed to decide before it records the decision. The Decision Reviewer role shows people only the reviews assigned to them.

More than a yes or no

Reviewers can approve a lower amount, choose how it's paid, set a date or correct a detail before the action runs. Each form asks only what that decision needs.

Every answer kept as evidence

A decision is tied to the exact action the reviewer saw, so it can't approve anything that changed afterward. It also shows up in your framework reports as evidence of human oversight.

veriproof.app/features/human-review

VeriProof

Follow one claim payout from request to record.

Every step is recorded with its time and the person or system that took it, so you can show any auditor how the payout was decided.

THE REVIEW ON THE FRONT, STEP BY STEP

10:02	**Held**	The claims agent asks to pay $18,400 to Harbor Point Roofing. Payouts over $10,000 need a claims supervisor, so VeriProof holds this one.	CLAIMS AGENT
10:02	**Sent**	The review goes to the claims supervisors, and the one assigned gets it as a personal card in Microsoft Teams.	TEAMS
10:09	**Decided**	The supervisor opens it from Teams and approves $16,900, the amount the adjuster's estimate supports, with a reason. VeriProof checks they're allowed to decide before recording it.	VERIPROOF
10:09	**Paid**	The claims system receives the signed approval, rechecks it against current policy, and pays $16,900.	CLAIMS SYSTEM
10:10	**Kept**	The payment confirmation joins the record beside the supervisor's answer, ready for your next audit.	VERIPROOF

Forms built around the decision

Up to 12 questions per form, from 13 field types. You choose which details a reviewer may change, and the rest stay as the agent sent them.

Approve or reject · Money · Percentage · Number or limit · Value within limits · Single choice · Multiple choice · Date · Identifier · Short answer · Revision feedback · Knowledge · Correction to the action

Hold any agent's action

Agent Gateway
Catches tool calls and model requests from any agent sent through it, including vendor agents you can't change.

VeriProof SDKs
Agents your team builds ask before they act, in TypeScript, Python, .NET, Go or Java.

When a review runs late

The action waits for an answer, and if none comes in time it stays stopped, so silence never approves a payout.

21%

of organizations have agentic AI governance capabilities in place, though 71% expect to deploy agentic AI within a year.[1]

A review step on your riskiest actions is a practical place to start.

Bring one approval

Pick an action your agents can't take alone yet, such as a payout or a refund over a limit. We'll show you how to set up its review, from the form to the evidence.
